

# Continuous measurements of indoor radon concentration with CR-39 detectors in two thermal spas - a case study

A.S. Silva & M. L. Dinis

CERENA-Polo FEUP - Centre for Natural Resources and the Environment

FEUP - Faculty of Engineering, University of Porto, Portugal

# 1. Introduction

- ▶ Radon ( $^{222}\text{Rn}$ ) is a colourless, odourless, tasteless radioactive gas, which may be found in indoor environments such as caves, homes, schools, and workplaces.

# 1. Introduction

---

- ▶ It is produced from the natural radioactive decay of uranium ( $^{238}\text{U}$ ), which is found in several types of soils and rocks such as granite and volcanic ones.

- ▶ In Portugal, the geological settings are mostly comprised of granite rocks with uranium mineralization, which represents a potential risk for the exposure to high indoor radon levels, particularly in some specific regions.

# 1. Introduction

- ▶ It is estimated that radon causes between 3–14% of all lung cancers in a country, depending on the average radon level and the smoking prevalence in a country (UNSCEAR, 2000; OMS, 2007).

**Radon and Smoking: A Dangerous Combination**

The infographic depicts a living room with a sofa, lamp, and stove. A thought bubble contains a house icon with upward arrows, a plus sign, a cigarette icon with smoke, and the text '10x the risk of lung cancer'. Below the bubble, it says 'If you live in a home with high radon levels, smoking raises your risk of lung cancer by 10 times.'

If you live in a home with high radon levels, smoking raises your risk of lung cancer by **10 times**.

# 1. Introduction

---

- ▶ The Decree-Law 108/2018, of December 3, which transposes into national law the EURATOM Directive 2013/59 of December 5, 2013, establishes the legal regime for radiological protection, setting the rules safety precautions for protection against the dangers arising from exposure to ionizing radiation (Euratom, 2013).

## 2. Objective

---

- ▶ Evaluate of radon concentration in indoor air in therapy rooms and technical areas of Portuguese thermal spa.

# 3. Materials and Methods

- ▶ Radon measurements were carried out by using CR-39 radon detectors during approximately 12 months covering continuous periods.

### 3. Materials and Methods

---

# Thermal Spa “A”

```
graph TD; A[Thermal Spa "A"] --> B[Winter]; A --> C[Spring/Summer];
```

Winter

21/12/2018 to 15/04/2019

(113 days)

Spring/Summer

15-04-2019 to 26/08/2019

(102 days)

# 3. Materials and Methods

## Thermal Spa “A”

# 4. Results

---

## Radon concentration in indoor air (Bq/m<sup>3</sup>)

| Place         | Winter | Spring/Summer |
|---------------|--------|---------------|
| Thermal Spa   | 344    | 305           |
| ORL           | 1283   | 1941          |
| Vichy shower  | 801    | 1175          |
| Nozzle shower | 1649   | 1310          |
| Bertholet     | 1747   | 1133          |
| Double cabin  | 415    | 366           |
| Spa pool      | 437    | 383           |
| reception     | 313    | 280           |

## 4. Results

---

- ▶ 94% (17/18) of the indoor air radon concentration values of spa A do not comply with Portuguese legislation (300 Bq/m<sup>3</sup>)
- ▶ That 100% of the sites do not comply with WHO recommendations for radon concentration in indoor air (100 Bq/m<sup>3</sup>).

## 4. Results

---

- ▶ Concentrations within the thermal spa vary widely, with a minimum of 280 Bq/m<sup>3</sup> and a maximum of 1941 Bq/m<sup>3</sup>
- ▶ In Bertholet (application of the heat and thermal steam in the vertebral region), nozzle shower, vichy shower and ORL spaces the indoor air radon concentrations are higher than the other spaces.

## 5. Conclusions

---

- ▶ The explanation for these results is due to the fact that in these places there is the use of natural mineral water, where radon is also present (Silva et al., 2017; Silva et al., 2016; Silva et al., 2015; Silva, 2015).

# Thank You
